MATH MASTERY SERIES

Direct Instruction

Direct Instruction (DI) is a teaching model created by Professor Siegfried Engelmann and the University of Oregon. Based on the premise that clear, unambiguous teaching enhances student learning, DI lessons are meticulously scripted in clear, unambiguous language, with each lesson structured in small incremental portions.

Farkota Direct Instruction

Adapting the scripted lesson concept, Farkota Direct Instruction (FDI) modernises the delivery process, and streamlines the script in a manner that strikes a balance between teacher-directed learning and student-directed learning. The role of the teacher in presenting the daily lesson is to deliver, diagnose and debug; the role of the student is to record and represent their data, and report their bugs.

FDI Math Mastery Series

The Math Mastery Series (MMS) programs (JEMM, JEMM+ and EMM) consist of daily scripted lessons composed of strands, each starting at base level where foundations are laid. They serve as daily diagnostic tools incorporating assessment as an integral part of the learning process. Student responses, coupled with their own analysis of any incorrect response given during a lesson, provide teachers with reliable diagnostic information better than any that can be acquired in a formal test situation. Being data driven, MMS allows teacher feedback to specifically target individual student misunderstanding.

Maximising every benefit an orally delivered program is capable of yielding, MMS programs:

- Map student progress
- Identify precisely where and when students experience difficulty
- Contain inbuilt assessment and correction procedures
- Instil fluency and automaticity in fundamental math skills.

THE MATH MASTERY SERIES PROGRAMS

EMM

Elementary Math Mastery

Ideally suited to upper primary and first year secondary students, and secondary school remedial classes.

Requires daily 20–25 minutes to implement, plus 5–10 minutes for corrections and feedback.

EMM features 160 lessons, each composed of 20 strands. Students answer one question per strand daily:

- Addition
- Subtraction
- Multiplication
- Division
- Number patterns
- Equations and inverse operations
- Whole number properties
- Fractions
- Decimals
- Measurement
- Space
- Geometry
- Average, percentage, ratio, chance
- Math language
- Money
- Time
- Algebra
- Visual perception
- Data analysis
- Problem solving

JEMM+

Junior Elementary Math Mastery+

Ideally suited to middle primary and upper primary students, and first year secondary school remedial classes.

Requires daily 20–25 minutes to implement, plus 5–10 minutes for corrections and feedback.

JEMM+ features 120 lessons, each composed of 15 strands. Students answer one question per strand daily:

- Counting
- Addition
- Subtraction
- Multiplication
- Division
- Number patterns
- Fractions
- Decimals
- Measurement
- Space
- Data and Chance
- Money
- Time
- Visual perception
- Problem solving

JEMM

Junior Elementary Math Mastery

Ideally suited to middle primary students, and upper primary school remedial classes.

Requires daily 20–25 minutes to implement, plus 5–10 minutes for corrections and feedback.

JEMM features 80 lessons. Students answer one question per strand daily with Lesson 1 introducing:

- Whole number addition
- Whole number subtraction
- Number facts
- Place value
- Number patterns

Building on these base strands the following lessons introduce:

- Lesson 21 Money
- Lesson 31 Measurement
- Lesson 41 Fractions
- Lesson 51 Time
- Lesson 61 Data and Chance

Each JEMM lesson concludes with Strategic Thinking: a hands-on approach to problem solving.

These programs help all students, but particularly those who:

- Have not reached required numeracy level for their age
- Have low motivation to learn, or low self-efficacy
- Are classified as at-risk learners
- Have difficulty concentrating, and would benefit from repeated structured teaching and practice.

MMSanimation

MMSanimation is a voice-over with animation for each lesson of the JEMM+ and EMM programs. These **animations reflect** the critical part of the Lesson **script** (shown in coloured CAPS) **that requires the teacher to point at the electronic display**. MMSanimation was created primarily for three reasons: firstly, absent students need to catch up; secondly, support for students with special needs; and thirdly, general teacher support. mathmasteryseries.com.au/mmsanimation

JEMM INTRODUCTORY NOTES

Generally speaking, mental math programs are warm-up exercises consisting of a ‘grab-bag’ of questions taken from various math strands with little constructive thought behind the design. Of limited value as learning programs, they do however perform one important function: the oral presentation and constraint on time pressures students to concentrate. Unfortunately, teachers are encouraged to, and often *do*, use them as work-sheets, thus failing to capitalise on the important contribution aural perception and pressure of time can play in the learning process. Although there has been a general failure to exploit the enormous developmental potential mental math programs are capable of yielding, the MMS is purpose-built to maximise this potential. Specifically designed around the document *Mathematics – a curriculum profile for Australian schools*, JEMM is a daily program for the entire class that can be easily integrated into any school’s math curriculum for middle primary and remedial classes.

JEMM comprises **10 core strands** (one question from each strand per lesson), **and** each lesson concludes with **Strategic Thinking**, a hands-on approach to problem solving. It requires **15–20 minutes to implement, plus 5–10 minutes for instant feedback, diagnosis and correction procedures**. Diligent implementation over the course of the school year will see students answering 600 questions (presented orally) at the end of which they will have achieved mastery (equated here with an average daily score of at least 90%) of fundamental math skills in all core areas.

Each JEMM strand **starts at base level** and moves through its particular field, merging and interrelating with the other strands being run concurrently. Since the **daily incremental portions learned by the students in each strand are small**, and because they are **reinforced and built upon** in subsequent lessons, **they are mastered**.

JEMM comes in a **teacher-friendly format with all lesson scripts provided; those with little math expertise will find it easy to implement**. Each lesson is complete within itself, and each strand has been choreographed with the focus on overall mastery of basic math skills. The teacher simply presents the program in the scripted format. The JEMM electronic reference stimuli (ERS) includes all diagrams, formulas and display material, maximising time efficiency and allowing for effortless implementation.

A perennial problem for teachers at the start of each school year is the diverse, and all too often, inadequate, academic standard of their new class. In an ideal world, teachers could safely assume that students entering their classroom on the first day of a school year would be capable of performing at a level appropriate to their particular grade, and that the foundations necessary for them to progress satisfactorily on their academic paths would be firmly in place. Unfortunately, this is seldom the case. A primary objective of JEMM is to address this problem.

At the outset, JEMM assumes nothing in terms of student academic level. The program has been **designed to accommodate every student, and elevate every student’s academic level no matter where they start from**, provided, of course, the students do not have significant learning disabilities. In the early stages of JEMM the questions are basic. Students with developed skills may wonder what the program has to offer. This will not last long. These basic questions quickly build into questions that will challenge every student. Of course, the challenge to some will be greater than others, but every student will have been taught the skills necessary to answer every question—there are no tricks.

The design of JEMM is such that **students discover for themselves the formulas necessary to solve problems automatically and speedily**. Students soon see they are up to the task, and because they know they have acquired the necessary skills, actually look forward to the challenge.

Once foundations to the core areas have been laid and tested, they are built on with small precise portions. None of this incremental information is left on the shelf. Students move on to questions that gradually increase in complexity, all the while relying on the skills they have acquired along the way. These **questions shift from abstract numbers to real-life situations**, so students see the relative worth of mathematics in situations that arise in the everyday world. Students quickly learn that everything they are taught is important; everything they learn is revisited, developed further, and gradually integrated into the broad mathematical landscape. This **gradual and consistent development of skills** is one of the key elements in the success of the Math Mastery Series.

The traditional practice of teaching mathematics in single topics creates many problems for students. Presenting them with a heap of new information in one hit and expecting them to master it, then move on to another, often unrelated topic, and master that too, and so on, is a big ask. The problem is compounded when students are not re-familiarised with the topics throughout the year. JEMM circumvents this problem by running concurrent strands. Because the strands are run concurrently, **students are soon familiar with the many connections existing between the various math disciplines, and become fluent and automatic in applying them.**

An essential feature of JEMM is its **ability to focus student attention** on the learning process. This is achieved by the teacher orally introducing the concepts and questions at a pace easily enough accommodated by students who are concentrating, but which gives them no time to tune out. Students stay alert because they know a question immediately follows the introduction of a concept. The **electronic reference stimuli (ERS)** further **enhances student engagement** and, in particular, **helps students with special needs** stay on track.

It is important to note that there should be no interruption to the lesson once in progress. The stream of student focus and concentration must be on what the teacher is saying. This is best achieved by conducting the lesson at a relatively brisk pace, and not stopping for queries or distracted students who want the question repeated more than once (all questions are put to the students twice). Queries should be attended to after correction time in *What bugs you?* Students who are used to working at a slower pace quickly learn what's required of them.

In maximising the benefits of JEMM, the importance of the teacher's role cannot be over-emphasised. Because the program's lessons are interdependent, and because the interrelating strands build entirely upon themselves, diligent teacher implementation is essential. The MMS Professional Learning Reading Plan could be used in this regard.

mathmasteryseries.com.au/professional-learning-reading-plan/

THE JEMM STRANDS

1 Whole number addition	6 Money
2 Whole number subtraction	7 Measurement
3 Number facts	8 Fractions
4 Place value	9 Time
5 Number patterns	10 Data and Chance
	11 Strategic Thinking

USING THE SCRIPT

JEMM provides teachers with alternate modes of delivery.

Electronic Reference Stimuli (ERS) includes all visual diagrams, formulas and display material
AND
Colour Masters for use where electronic delivery is unavailable.

Both modes have been incorporated into the script.

Note: ERS download information is provided by email at time of purchase. For queries contact hello@mathmasteryseries.com.au.

1 Refer to ERS Question 1 or Colour Master.

SNAPSHOT

1	2	3	4	5	6	7	8	9	10	11	12
---	---	---	---	---	---	---	---	---	----	----	----

When counting from 1, the first 12 numbers are: **ONE, TWO, THREE, FOUR** (pause) **FIVE, SIX, SEVEN, EIGHT** (pause) **NINE, TEN, ELEVEN, TWELVE**.
Look at the number **FIVE** (continue pointing to 5).
If you add **1 more** to 5 (point to 6 and pause) you get the next number.

QUESTION 1 What number is **1 more** than **FIVE**? (Repeat question)
Write your answer in today's column next to Question 1.

What you do appears in *italics*.

What you say appears in this type.

What you stress is in **bold text**.

What you say and simultaneously point at on the electronic display or the whiteboard appears in **CAPITAL LETTERS**.

PROGRAM STRUCTURE

JEMM consists of 80 scripted lessons structured in rounds of five. Whenever a new concept is introduced, it will always be in the first lesson of a round. It is in the last lessons of the rounds where these concepts will be put to the test.

	Number of sessions to complete MMS			
	EMM	JEMM+	JEMM	TOTAL
Teacher delivered scripted lessons	160	120	80	360
Student Self-evaluations	8	6	4	18
Marathons	40	30	20	90
EMM/JEMM+/JEMMathon tasks	8	6	4	18
Round tasks	24	18	12	54
Challenges	4	4	4	12
TOTAL number of sessions required	244	184	124	552

JEMMathon 4 TASK	120

SESSION	NUMBER
CHALLENGE 1	121
CHALLENGE 2	122
CHALLENGE 3	123
CHALLENGE 4	124

Scheduled time

Lessons should be scheduled for the mornings.

myJEMMdata Student Workbook

The role of the teacher in presenting the daily lesson is to deliver, diagnose and debug; the role of the student is to record and represent their data, and report their bugs.

MMS, being data driven, means capturing that data is critical to teacher diagnosis and the students' consequent path to mastery.

The workbook is the equivalent of a GPS, monitoring the quality of implementation, and tracking both teacher performance and student achievement. It is an academic journal, where students employ daily various forms of data representation to record, summarise and represent their own all-important data, thereby enabling both teacher and student to specifically target misunderstanding and monitor progress.

Delivering a particularly strong educational component, the workbook slots in perfectly with the Australian Curriculum Sub-strand, Data Representation and Interpretation.

To assist the teacher in explaining visual aspects of the workbook, Electronic Reference Stimuli is available at the below link. Also available are Descriptors structured into five major elements describing the skills and knowledge students typically acquire as they become more adept.

mathmasteryseries.com.au/student-workbook/

Workbook components:

Daily Data: Each day, students record and summarise their own data. For incorrect responses, classified as Bugs, students shade the BugKey in the corresponding row on the BugBoard. This allows teachers to continually monitor progress and determine whether remediation is needed. For example, see myJEMMdata pages 2–9.

Visual representation: This provides foundational knowledge and daily practice in reading and interpreting data to prepare students for the *Round task*. For example, see myJEMMdata pages 2–9.

Round task: JEMM is structured into 16 rounds each consisting of 5 lessons. At the end of each round students read, interpret and complete tables and graphs building on the *Visual representation* foundational knowledge. For example, see myJEMMdata pages 10–11.

Self-evaluation: After every 4 rounds (20 lessons) students self-evaluate and reflect on their growth in knowledge, understanding and achievement. They record their feelings, providing teachers with an insight into their thoughts, and the opportunity to comment. For example, see myJEMMdata pages 12–13. Thanks to Kevin Duffy, Principal WA, for his valuable input here.

JEMMathon: These restructured lessons enable students to demonstrate their BugFree status. JEMMathons affirm fluency, further enhance self-efficacy, and assess how well students have consolidated their knowledge and understanding. For example, see myJEMMdata pages 14–15.

JEMMathon to BugFree: Students convert their scores to percentages to determine their BugFree status. This encourages students to concentrate on personal growth rather than comparison with other students. Conversions should be performed either after each JEMMathon, or after each Marathon. See myJEMMdata pages 58–61.

Challenge: These are designed to stimulate the thinking process, requiring students to reflect on what they have learned. Ideally, they are implemented at the end of the JEMM program. See myJEMMdata pages 62–65.

Awards: These motivate and reward students by emphasising growth, effort and completion of tasks. Club BugFree Award: For students who score all correct responses over a number of consecutive lessons. The recommended benchmark for this award is 20 consecutive lessons. Eight awards are provided allowing teachers to lower the benchmark at their discretion. See myJEMMdata pages 67–69. Optional awards (Accurate Marking Award, Neat Workbook Award) could also be assessed in 20 lesson blocks. See myJEMMdata pages 71–77.

INTRODUCTORY SCRIPT FOR IMPLEMENTING MMS WITH myJEMMdata Student Workbook

1. *Write on board: Lesson 1 and today's date.*
2. *SAY:* Open your Workbook to page 3 and find Lesson 1. You are going to write your answers to Lesson 1 in this column. Write the **DATE** above Lesson 1.
3. *SAY:* Now look at page 2 and find the Lesson 1 Workspace. Use this space to work out what you cannot do in your head.
4. *Follow the Junior Elementary Math Mastery Lesson 1 script pages 2–4 up to the corrections.*
5. *SAY:* Over the coming lessons I may decide to make an award for accurate marking.
6. *Correct all questions, see JEMM page xi.*
7. After corrections and before debugging *SAY:* Look at page 3 and find the word BugBoard. A Bug is an incorrect response where you are unable to understand why you are wrong. Look at the BugBoard. For those incorrect responses classified as Bugs, shade the BugKey on the corresponding row under the column headed one.
8. *DEBUG, see JEMM page xi.*
9. After debugging *SAY:* Look at page 2 and find the arrow at the bottom of the page. The arrow is pointing to the Visual representation images. I'll read what it says. You follow: **For each Lesson the whole of my data is represented in a bar made of 5 squares. From the baseline, I summarise my data by shading the number of squares equal to my score.** You can see the bar under Lesson 1. From the baseline, shade the number of squares equal to your score.
10. *Observe and check students have followed correctly.*
11. *Introduce students to the Strategic Thinking Unit.*

Note: At the end of Lesson 5, introduce the first Round task. Ideally, a Round task requires an entire session and should be completed before commencing the next lesson.

SAY: Look at page 3 and find the arrow at the bottom of the page. The arrow is pointing forward. I'll read what it says. You follow: **After recording and summarising my data for these 5 lessons, I go to page 10 and complete my Task for this Round.** Everyone turn to page 10 and complete the Round 1 Task.

JEMMATHON

After students have self-evaluated their first group of 20 lessons (myJEMMdata page 12), teachers are advised to run a JEMMathon.

A JEMMathon is made up of 5 Marathons. A Marathon consists of 4 lessons from the previous 20, where the teacher presents all questions without any teacher modeling (i.e. teacher presents the question only).

The first Marathon (myJEMMdata page 14, coded M01 in the plan below) revisits Lessons 1, 2, 3 and 4 (coded L01–L04), where only the question is presented. The second Marathon (M02) revisits Lessons 5, 6, 7 and 8 (L05–L08) etc. After the first JEMMathon is completed, teachers return to the program presenting Lessons 21–40 as per the JEMM script.

After students have self-evaluated their second group of 20 lessons (myJEMMdata page 26), teachers run a second JEMMathon (myJEMMdata page 28), then return to the program, and so on. Each of the darker shaded sections below denote a JEMMathon round. A JEMMathon round consists of 20 lessons restructured into 5, effectively adding 20 sessions to the JEMM program.

JEMM L01–L20		JEMM L21–L40		JEMM L41–L60		JEMM L61–L80					
Self-evaluation	M01	L01–L04	Self-evaluation	M06	L21–L24	Self-evaluation	M11	L41–L44	Self-evaluation	M16	L61–L64
	M02	L05–L08		M07	L25–L28		M12	L45–L48		M17	L65–L68
	M03	L09–L12		M08	L29–L32		M13	L49–L52		M18	L69–L72
	M04	L13–L16		M09	L33–L36		M14	L53–L56		M19	L73–L76
	M05	L17–L20		M10	L37–L40		M15	L57–L60		M20	L77–L80
JEMMathon 1		JEMMathon 2		JEMMathon 3		JEMMathon 4		JEMMathon to BUGFREE			

Teachers may consider commencing JEMMathons later in the program or adapting them in some other way that better befits the ability of their students. For example, a Marathon could consist of a set of 4 lessons from any previous lessons. See pages 84–85 myJEMMdata Student Workbook for optional template.

Electronic Reference Stimuli: JEMMathon – see ERS provided by email at time of purchase. For queries contact hello@mathmasteryseries.com.au.

JEMMathon to BUGFREE

JEMMathons provide students with the opportunity to demonstrate they are BugFree; they affirm fluency and further enhance self-efficacy. Following the first JEMMathon students should complete JEMMathon 1 Task, myJEMMdata page 58, and then, go to page 60 and convert their own JEMMathon 1 scores to BugFree levels. Conversions should be performed after each JEMMathon.

PRETEST

Before beginning the program, Lesson 40 and/or Lesson 80 may be used as a pretest. Once Lesson 40/80 has been completed the results can be compared to the pretest. (Thanks to Far North Queensland Region, Education Queensland, for this suggestion.)

CORRECTIONS

It is essential to be consistent with corrections.

The following is a suggested plan:

- Students exchange books for corrections
- Teacher selects students to answer from the work they are correcting
- Teacher announces the question number and the selected student calls the answer
- Teacher repeats the given answer indicating correct – if incorrect teacher selects another student to respond, and so on
- Students circle any incorrect response – if correct no mark recorded.

To gauge instant feedback on the overall class performance, have students raise hands each time they mark an incorrect response.

After marking:

- Books are returned and students record their total number of correct responses at the bottom of the column for that lesson
- Students shade incorrect responses classified as Bugs (see below) in the corresponding row on the BugBoard (see page xiv).

At a glance the teacher can now gauge the overall performance of each student, for each strand, for each round. Students who score all correct responses over 20 consecutive lessons receive a Club BugFree Award. Teachers may lower the benchmark at their discretion.

WHAT BUGS YOU?

A BUG is an incorrect response where the student is unable to understand why they are wrong. **It is crucial to DEBUG directly after corrections.** Select students to identify questions that are causing them concern (*What bugs you?*). Revisiting the script with class discussion may be required here. **This debugging process is the most critical step on the path to mastery.** NOTE Strategic Thinking: Because the intention is to encourage students to solve problems on their own, the challenges should not be debugged.

LOW-PERFORMING STUDENT SUPPORT: CHIN-IT APPROACH

The MMS was designed for single class grade groups, however, low-performing students may benefit from working in a group following the MMS CHIN-IT approach. In a nutshell, the CHIN-IT approach involves the teacher presenting each round twice (5 lessons make up a round). In the first presentation of the round, sections are presented lock-step with students writing each response on their individual whiteboards, and then they CHIN-IT (display whiteboard under chin); the teacher scans the responses and if no errors are evident, moves on to the next section etc, otherwise the teacher debugs errors. If after three attempts the question is not debugged the teacher moves to the next section, noting students who need individual attention. After the round has been completed, or after each lesson, the teacher repeats the round (or lesson) **as per normal** (i.e. presents entire lesson, corrects, and debugs the student-identified bugs recorded in their Student Workbook).

PLACEMENT INTO PROGRAM

Because JEMM assumes nothing in terms of student academic level, all students must enter the program at Lesson 1. If students achieve an overall success rate of 100% in the first two Rounds (Lessons 1–10), continue the program by presenting the questions only. Once student overall success rate in a Round drops below 100%, return to the beginning of the previous Round and repeat those lessons using the entire script.

PREPARING TO TEACH JEMM

Read pages i – xv, and then familiarise yourself with the script by reading the first Round (Lessons 1–5). Set up and check electronic equipment for ERS. If using a non-electronic delivery, prepare copy (A3 or larger) of *Colour Masters* (see below). If you are not using the myJEMMdata Student Workbook, have students prepare workbooks for Round 1 (see page xiv) prior to commencing the program.

When introducing students to JEMM explain that in the beginning lessons they will be working with basic skills they probably already have, however, in order to meet the challenges ahead they will need to become fluent (able to respond accurately and without hesitation) and automatic (able to respond without conscious attention) with these skills. Go to Lesson 79 and present Section 7 by way of example. Go next to Lesson 1 and present Section 1 to demonstrate the manner in which you will be delivering the lessons. Explain the lesson structure.

LESSON STRUCTURE

- 15–20 mins: Intensive teacher-directed instruction

Using script, teacher models at a brisk pace, but not too fast. Each sentence should be delivered in small chunks. For example: “The difference between two numbers” *pause* “tells how much more or less” *pause* “one number is than the other”.

No interruptions—student focus must be on the teacher.

Teacher poses a question for each strand. Length of time for student response depends on degree of difficulty – could be as little as 5 seconds. Students respond by writing answer in the column assigned to that lesson. Students may do calculations on the facing page.

- 1–2 mins: Corrections
- 2–8 mins: DEBUG (see page xi)
- 2–5 mins: Strategic Thinking

STRATEGIC THINKING

Units consist of 20 interlinked lessons. Blackline Masters (page 345) provide for related Materials. Please follow instructions found at the end of each lesson.

COLOUR MASTERS (Non-electronic delivery only)

Teachers are advised to print and laminate an A3 size copy of each Colour Master before commencing the MMS. The Colour Masters found on the ERS should be displayed prior to the lesson. These Masters replicate the snapshots shown in the lessons. They contain detailed board work that may be time-consuming for the teacher to write up.

IMPLEMENTATION CHECKLIST

A regular school review of the quality of implementation, and the school's systematic action to improve it, will strengthen teacher performance and enhance student achievement. To this end, the checklist could be used; it aims to encourage teachers to work together, sharing what teaching behaviours work well, and identifying what behaviours might need refining.

Teacher _____ Peer _____ Date ____ / ____ / ____

Category	Key indicators (use check marks)	Comment
Organisation and management of classroom (Initiating)	<ul style="list-style-type: none"> <input type="checkbox"/> Workbook distribution routine <input type="checkbox"/> Lesson procedure evident <input type="checkbox"/> Student awareness of procedure 	
Teacher delivery	<ul style="list-style-type: none"> <input type="checkbox"/> Voice clear and firm 	
Follow lesson script	<ul style="list-style-type: none"> <input type="checkbox"/> Delivery without digression <input type="checkbox"/> Points to Visual Display as required <input type="checkbox"/> Corrections completed <input type="checkbox"/> DeBugs directly after corrections 	
Lesson pace	<ul style="list-style-type: none"> <input type="checkbox"/> Delivery brisk but not too fast <input type="checkbox"/> Sentences delivered in chunks <input type="checkbox"/> Student response time adequate 	
Corrections	<ul style="list-style-type: none"> <input type="checkbox"/> Directly after final question <input type="checkbox"/> Performed quickly <input type="checkbox"/> Procedure consistent 	
Teacher attention	<ul style="list-style-type: none"> <input type="checkbox"/> Delivery of script: watches faces <input type="checkbox"/> Student writing: watches workbooks <input type="checkbox"/> Corrections: watches students 	
DeBug	<ul style="list-style-type: none"> <input type="checkbox"/> Procedure evident 	
Student Workbook	<ul style="list-style-type: none"> <input type="checkbox"/> Lesson dated <input type="checkbox"/> Incorrect responses circled <input type="checkbox"/> Bugs identified on BugBoard <input type="checkbox"/> Tasks completed (e.g. Visual representation; Round tasks; Self-evaluation; Marathons) <input type="checkbox"/> Student pride and care evident 	
Organisation and management of classroom (Closing)	<ul style="list-style-type: none"> <input type="checkbox"/> Routine for completed lesson <input type="checkbox"/> Routine to monitor Workbook data <input type="checkbox"/> Positive approach 	

FOR THOSE NOT USING PRESCRIBED WORKBOOK

Ideally, use a 48 page exercise book. There are 80 lessons or 16 rounds. For diagnostic purposes (see Corrections page xi) each round of 5 lessons should be contained within a double-page spread.

WORKSPACE

Lesson 61		Date
Lesson 62		Round 13
Lesson 63		Question 1 Whole number addition
Lesson 64		Question 2 Whole number subtraction
Lesson 65		Question 3 Number facts
		Question 4 Place value
		Question 5 Number patterns
		Question 6 Money
		Question 7 Measurement
		Question 8 Fractions
		Question 9 Time
		Question 10 Chance and data
		My score
		Out of

10 cm

For each Lesson the whole of my data is represented in a circle divided into 10 slices. For each correct answer I shade the slice containing that question number.

Visual representation

After recording and summing my data, I go to page 52 and complete my Task for this Round.

DAILY DATA ROUND 13 45

Each Daily Data right-hand page should be ruled as shown in the myJEMMdata Student Workbook (see snapshot above). The right-hand page is for recording answers, one column per lesson. If students miss a lesson, the column should be left until they catch up. The left-hand page is for rough working out.

Other components of the myJEMMdata Student Workbook are too complex to replicate. These include: Round task; Self-evaluation; JEMMathon to BugFree; Challenge. However, Student Awards are available for download in PDF format.

AUTHOR'S NOTE

The student-directed versus teacher-directed learning debate is an ancient one; indeed, the polemic goes back to Plato. In her doctoral research: <https://www.acer.org/files/FarkotaThesis.pdf> the author carried out a comprehensive review of the relevant research and literature, and reached the inescapable conclusion that some skills were better acquired through one approach, and some through the other. When it came to the employment and cultivation of higher order skills, where reasoning and reflection were required, it was clear that a student-directed approach to learning was better suited. But when it came to the acquisition of basic skills, the empirical evidence unequivocally showed that a teacher-directed approach won out.

It is well accepted that problem solving skills operate from a knowledge base that has been acquired through practice; in fact, genuine competence in both problem solving and basic skills *only* comes with practice. Significantly though, it is actually when the base knowledge in a discipline is being acquired that the foundations for effective problem solving are being laid. Because the essential knowledge required for automaticity is stored in the long term memory, it is best retained when explicitly taught and practised repeatedly. This automaticity, originating from practice, empowers students to maximise their mental capacity by concentrating exclusively on the more complex task of problem solving.

It is also well accepted that to perform a task competently one requires not only the requisite skills, but also the self-belief in one's ability to implement performance. In the learning process this is termed *self-efficacy*, and when laying the foundational skills in mathematics, or for that matter any academic discipline, student self-efficacy must be accommodated. Students with low self-efficacy in a particular skill area are reluctant to engage in tasks where those skills are required, and if they do, they are more likely to quit when encountering difficulty.

Students engaged in the learning process automatically monitor their progress. For this reason the capacity to self-evaluate progress is an integral and ongoing component of the JEMM program. Because JEMM tasks gradually increase in difficulty, students have clear criteria by which they can independently assess their performance and gauge their progress. As they progress they acquire more skills and become more proficient at the self-evaluation process.

JEMM lessons were deliberately designed not to be seen as tests, but testing is precisely what is happening on a daily basis. Without being conscious of it, students are willingly engaging in ongoing assessment. As such the lessons serve as a powerful diagnostic tool clearly mapping student progress, identifying precisely where and when they are experiencing difficulty. Their responses, coupled with their own analysis of any incorrect response they have given during a lesson, provide teachers with reliable diagnostic information better than any that can be acquired from a formal test situation. This is crucial to JEMMs success as it allows for teacher feedback to specifically target individual student misunderstanding. Because students receive this daily feedback on their performance, they are acutely and immediately aware of their progress, which strengthens their self-efficacy, sustains their motivation, and enhances their academic achievement.
